Product introduction · Case study

Sanjaq

Every project decision, in one place, with a trail.

Software for design studios, so they always know what was decided, when, why, and who approved it.

Brief | Scope | Design & feedback | Decision | Client approval | Receipt | Changes

Live demo: dibarahbar.github.io/Sanjaq

November 2026

01 · What is Sanjaq?

“Sanjaq” means *pin*: pin the decision to the design

Every design project involves dozens of decisions: which version is good, what must change, what the client has accepted. Sanjaq pulls these decisions out of chats and emails and keeps them next to the exact version of the design they belong to.

For the studio

Every morning it is clear which project is waiting on whom and what the next step is.

For the client

With one link and no account, they see the version, approve it, and get a receipt.

For tomorrow

When a dispute comes up, we open the decision log instead of searching through messages.

02 · The problem

A story every studio knows

The project was going well. Weeks later the client says: “We never asked for this!” and the team has to dig through emails and chats for proof.

Which version is the latest?

When did we decide that?

Where is the approval?

Was this change in the contract?

The result

Team time goes into searching, arguments rest on memory, and the client relationship suffers.

03 · The solution

Sanjaq in five steps

Every project follows a clear path. Each step opens only after the previous one is done, so nothing falls through the cracks.

1

Brief & scope

The client’s request is recorded and it becomes clear exactly what work will be done.

2

Design & feedback

The team sends the design and feedback is placed right on the spot it refers to.

3

Record the decision

The outcome of each discussion is written in the decision log, with the reason.

4

Client approval

The client approves in two steps and receives a receipt.

5

Later changes

Every new request has its own path and never breaks the earlier agreement.

The morning starts with one glance

The project list tells you in one sentence how many projects need your action and how many are waiting for the client. Each project also shows which of the five steps it has reached.

> A project manager shouldn’t have to open ten projects to learn where to start.

Project list (sample data; the interface is in Persian)

AI suggests items from the brief text and shows the supporting sentence from the brief next to each one

AI helps, you decide

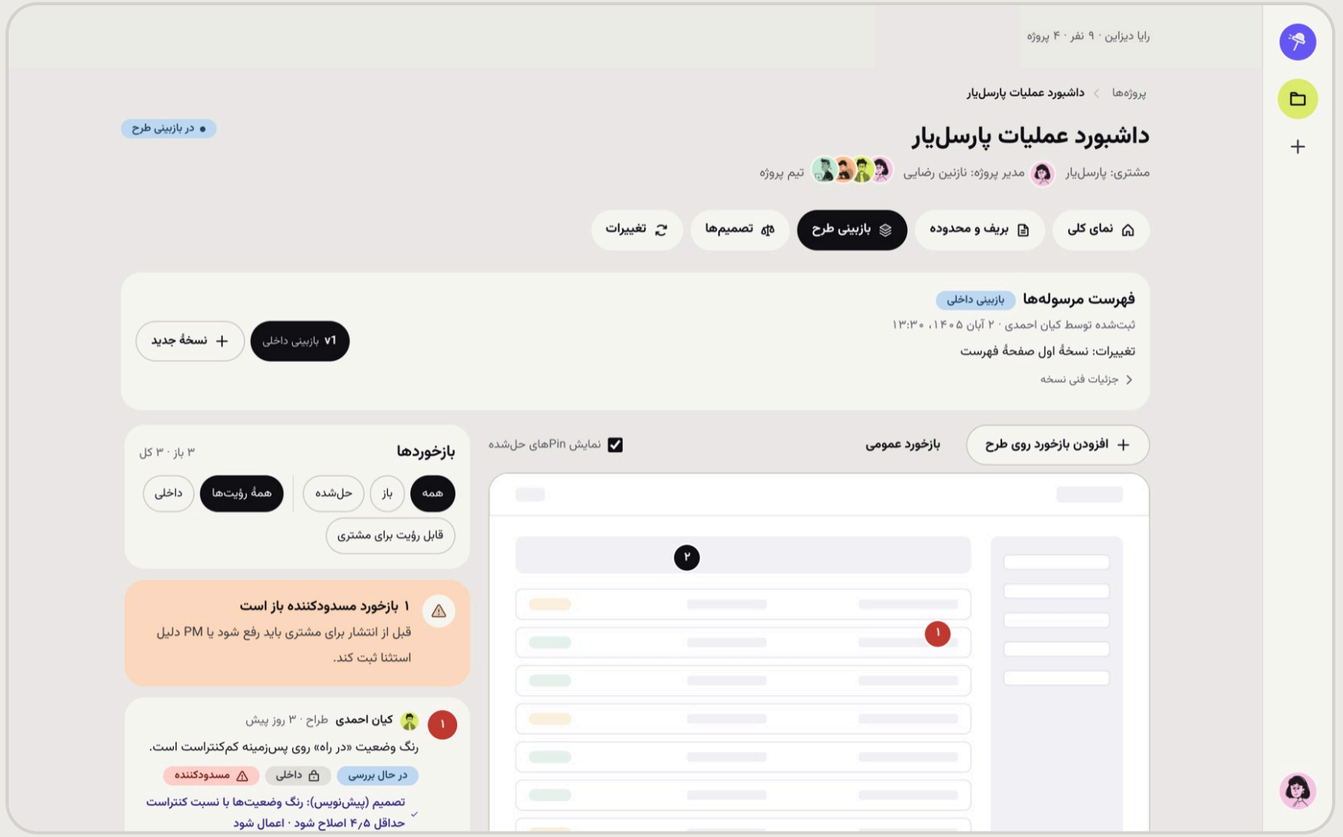

Sanjaq suggests the project goal and audience from the client's brief, under three rules:

- Every suggestion is labelled "AI suggestion" and is not valid until you approve it.
- Every suggestion shows its source sentence from the brief.
- Anything the brief doesn't say stays "unknown", never guessed.

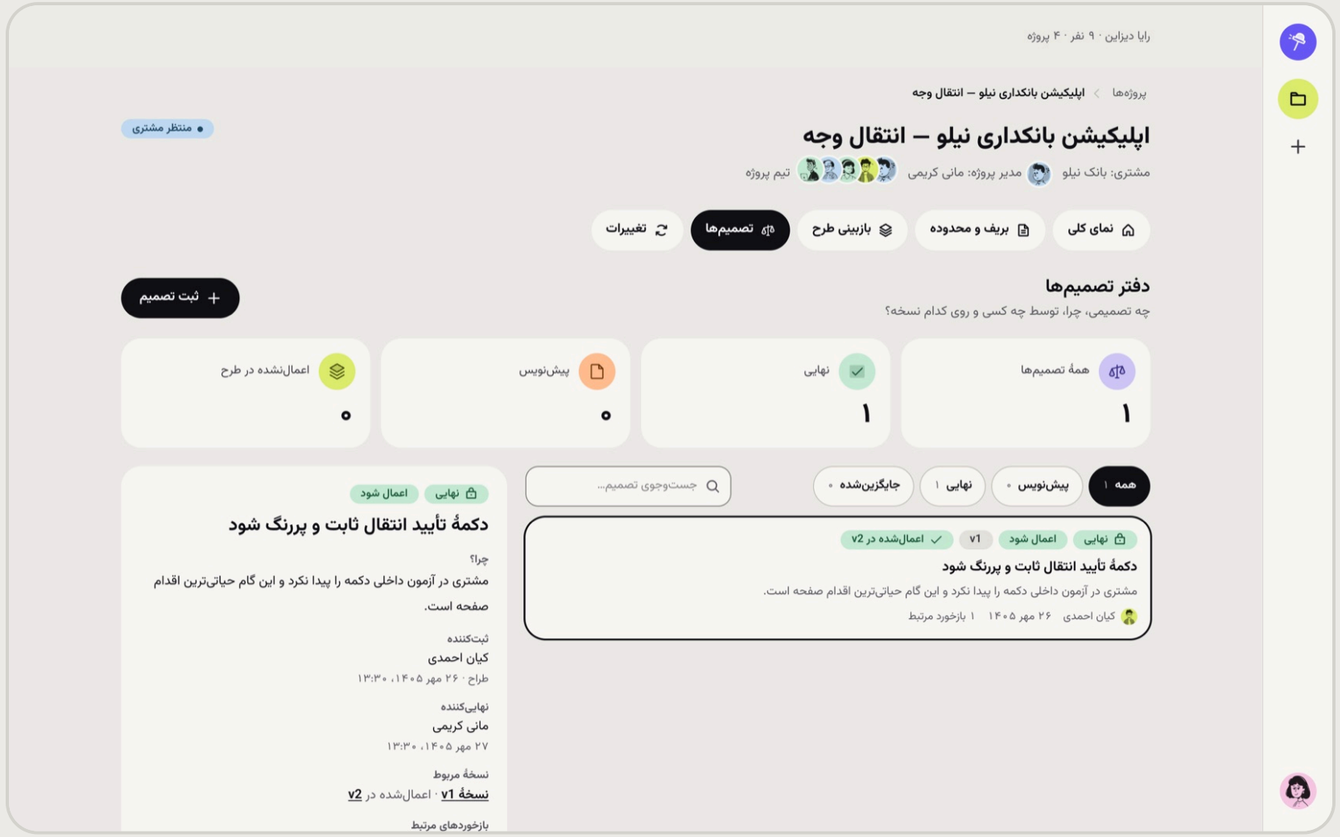

If something important is unknown (such as "What are the acceptance criteria?"), the scope cannot be approved until it is resolved.

Put feedback on the design itself

- **A pin on the design:** feedback attaches to the exact spot on that version, not to a message lost in a chat.
- **Critical feedback holds the release:** until it is resolved, the design is not sent to the client.
- **Internal or client-visible:** the team controls what the client sees.
- **A sent version never changes:** a correction means a new version, not a silent edit.

Review page: the feedback list and numbered pins on the design

A log that can’t be erased

Each decision is written with its “why”, the name of who recorded it, and the version it relates to.

> If we change our mind, the old decision isn’t deleted. A new decision replaces it and the history stays. “Why did it change?” always has an answer.

Decision log: each decision with its reason, who recorded it, and the related version

08 · Step four: client approval

The client approves with one link and gets a receipt

The client doesn’t need an account. They see the published version and read exactly what they are accepting before they approve.

- Approval takes two steps, so it can’t happen by accident.
- The receipt states who approved which version, and when.
- The client sees only what the team has published for them; internal notes stay hidden.

This receipt is recorded in Sanjaq and does not replace a legally signed contract; the page itself says so.

The client reads before approving

Approval receipt

09 · Step five: changes after approval

Late changes, without breaking the agreement

After approval, a new request such as “please add one more page” follows a separate path:

Client request | Questions & answers | Classification | Team assessment | Proposal | Decision

If the proposal is rejected

The earlier agreement and receipt stay untouched.

If it is accepted

A new agreement is recorded, and the previous one remains in the history.

The question “Was this in the contract?” is settled by records, not memory.

10 · What changes?

One less worry for everyone

Project manager

Before: searching chats for the latest approval.

With Sanjaq: each project’s next action is on screen and approvals are recorded with a receipt.

Designer

Before: scattered, unnumbered feedback.

With Sanjaq: each comment sits on a spot in the design and stays tied to its own version.

Client

Before: unsure what exactly they approved.

With Sanjaq: one simple link and a receipt they can reopen whenever needed.

Studio head

Before: disputes depended on people’s memory.

With Sanjaq: decisions with reasons and dates stay in one log.

11 · Trust

Four promises the product is built on

1

AI doesn’t rule

It only suggests, with sources. Approval always belongs to a person.

2

Everything ties to a version

Feedback and decisions always say which version they belong to.

3

Approval is provable

Approval is explicit, two-step, and comes with a receipt.

4

Changes don’t break agreements

Every change after approval has its own path and its own trail.

Five stages, each approved by the product owner

1

Rules before looks

The working rules (such as “an approved version never changes”) were written first and checked with automated tests.

2

First prototype

The four main flows were built end to end: brief, feedback and decision, client approval, changes.

3

Visual design

Color, typography and interface components were made consistent.

4

Owner feedback

Using reference images, the visual direction changed from plain black to soft, meaningful colors.

5

Audit & fixes

Usability and accessibility problems were listed and fixed.

13 · Status today

What is ready and what is not

80 automated tests passing for the product's core rules

12 screens checked at three screen sizes with no automated accessibility errors

4 main flows, from brief to changes, work end to end

Not there yet (honestly)

- Data is fictional and there is no real server; login is for demonstration only.
- Not tested with real users, so we claim no time-saved or satisfaction numbers.
- Screen readers, real phones and other browsers have not been checked yet.

Next steps

- Test with a few real studios around one simple question: "How long does it take to find a past decision?"
- Build a real server and real sign-in.
- Check with assistive tools and real devices.

Summary

Sanjaq aims to answer two questions in seconds:

“When and why did we make this decision?”
“Which version did the client approve?”
